4. Tech.html- Tech Hub page
5. Money.html- Money Hub page
6. Writeblog.html- Write page

Primary CSS files

1. Home.css
2. Food.css
3. Fitness.css
4. Tech.css
5. Money.css
6. Writeblog.css

Primary JS files

1. Home.js
2. Food.js
3. Fitness.js
4. Tech.js
5. Money.js
6. Writeblog.js

BACKEND SERVER REQUIREMENTS

- Write blog:

When a user completes and publishes a blog post, it should be stored on the backend server and displayed on one of the four designated pages: Food Hub, Tech Hub, Money Hub, or Fitness and Health Hub. To streamline this process, we have included a set of predefined tags: Food, Tech, Money and Fitness and Health. For example, if a user uses a Food hashtag, the post should be published on the Food Hub page. Users also have the option to use custom tags.

#food #money #tech #fitness and health

PUBLISH BLOG

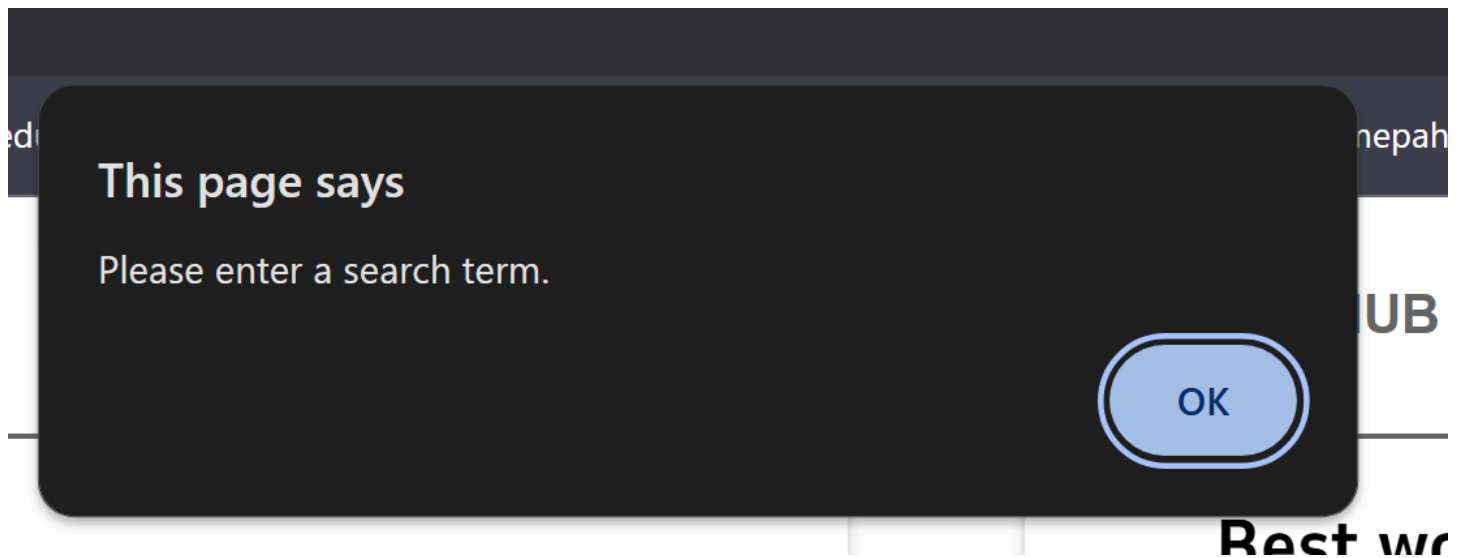

Note: Additionally, the banner items should be dynamically updated to reflect the latest content.

Currently, the "Banner Items" pages have been hardcoded, but they should be saved on the backend server.

- ☐ Read more: When the user clicks on the read more button he should be redirected to the respective blog page.

Currently, the "Read More" pages have been hardcoded. The files containing this hardcoded code are: foodblog1.html(latest post number 1), foodblog2.html (latest post number 2)and foodblog3.html (latest post number 3). All the 3 files have been connected to a single css file namely blog.css.

NOTE: The name of the files for other page are in the format pagenameblog.html. For example: fitnessblog1.html, moneyblog1.html and techblog1.html all these files are connected to a single css file that is blog.css
